- Google Chrome is a registered trademark of Google Inc.

## General information

A note for female users:

For better legibility, we are omitting the explicitly separate mention of male and female users in this documentation. However, we want to expressly point out that we always refer to both women and men.

## Highlights in the text

Highlights are used in this documentation as follows:

<b>Bold</b>	Refers to menu commands, buttons, field names, options, program names and program groups. Examples: the <b>New</b> command, in the <b>Name</b> field
“Quotation marks”	Refer to menu titles, folder names and dialog fields. Examples: the “User” menu, the “Smartcards” folder, the “Set password” dialog field
UPPERCASE LETTERS	Are reserved for the representation of keys. Examples: RETURN key, ALT key
(Brackets)	Show that a placeholder symbol is meant. Examples: (%) ( ) during the PROXESS search

## Tips

	Show you particularly convenient options for the operation or useful additional information. Tips are always represented as they are in this paragraph.
---	---

## Warnings

	Are displayed for actions that could result in significantly more work or might even lead to data loss or other material damages. Warnings are shown by this symbol:  <b>You should read the warnings very carefully before you continue working.</b>
---	---

## About PROXESS Registry Setup

Specifications saved in the Windows system registration are required for the complete configuration of PROXESS which corresponds to your requirements. PROXESS Registry Setup is available to you so that you do not need to manually enter the corresponding values in the Windows registration editor. With this program, you save the desired values for the various different PROXESS server modules.

### **Which modules do you have to register?**

For the server modules (Document Manager and Database manager), registration is required in any case. For the Event Log Agent, on the other hand, registration is only required if you have installed this module.

### **Can you change values in the registration?**

You should only change values in the registration if you are completely sure that it will not cause systems errors. If in doubt, contact your supplier for support. Errors in the registration can lead to your PROXESS system no longer working properly.

## Install menu

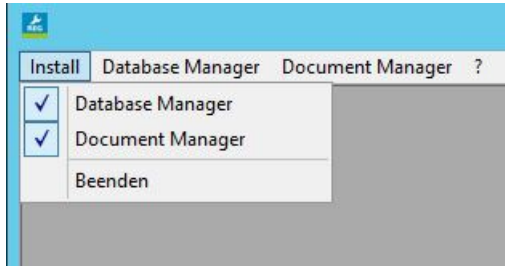

Figure: "Install" menu

Using the commands in the "Install" menu, you can set up the registration branches for the individual PROXESS modules. You can quickly and easily fully delete the registration of a PROXESS module later on using the commands. Also read the corresponding step-by-step instructions in the help information for for this.

As soon as you have set up a registration branch, a check mark appears in front of the corresponding command in the "Install" menu. You can then edit the registration values of the branch. As long as this has not yet been done, the commands in the corresponding menu are inactive.

### Tip

The default values for registration are not automatically set when the registration branches are set up. For this purpose, select the command from the desired menu and accept the specifications.

You can configure the Storage Manager using the Storage Manager Explorer.

---

### See also:

[How to set up a registration branch](#)

[How to delete a registration branch](#)

## How to set up a registration branch

You cannot make the registration settings for a PROXESS module until you have set up the corresponding registration branch in Registry Setup.

1. In the "Install" menu, select the registration branch which you would like to set up. The "Registry Values" dialog box opens.
2. In the **Do you want the registry** option group, activate the **set up option**. This option is already activated by default.
3. Close the dialog box with **OK**.

There is now a check in front of the selected registration branch in the "Install" menu. You can now carry out registration for the corresponding PROXESS module.

## How to delete a registration branch

With Registry Setup, you can quickly and easily delete the entire registration of a PROXESS module again if necessary.

1. In the "Install" menu, select the registration branch of the PROXESS module whose registration you would like to fully delete. The "Registry Values" dialog box opens.
2. In the **Do you want the registry** option group, activate the **delete** option. This option is already activated by default.
3. Click **OK**. A security prompt appears. Confirm this with **Yes**.
4. The check in front of the selected registration branch in the "Install" menu has now disappeared, and the commands in the corresponding menu are inactive again.

## License command

Figure: "Database Manager License" dialog box

Store the path to the license file for the PROXESS Database Manager. The License.txt value is specified first by default. If you accept this value, PROXESS searches the license file in the working directory in which the PROXESS Database Manager is located. If the PROXESS server is to be started as a service, the absolute file path must be entered at this point (example: c:\programs\proxess\license.txt).

You can select the license file using the  button. Note that you can then only successfully start the Database Manager if the corresponding license file is specified.

	If the Database Manager is to be started as a service, you have to enter the absolute path here (e.g. C:\Proxess\License.text).
--	---

<b>Registration key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\SHD\Document!\Dbil
<b>Brief description</b>	Specification of the license file for the Database Manager.
<b>View</b>	Click the View button to view the license file.

## Output medium

<b>Value name</b>	CallLogTarget
<b>Data type</b>	REG_DWORD
<b>Default value</b>	0 (= no output)

With this value, you can specify where the RPC log file is output:

<b>CallLogTgt</b>	<b>Output medium</b>
<b>0</b>	No output
<b>1</b>	DbWin32
<b>2</b>	Log file (recommended)
<b>3</b>	DbWin32 and log file

**DbWin32** is a small shareware program which you can obtain from our support department if necessary. Changes are also detected by the Database Manager during operation. For this reason, stopping and starting the service is not necessary. If logging has to be activated, we recommend outputting to a file, as this is easier for the support department of your supplier to handle.

# Logging command

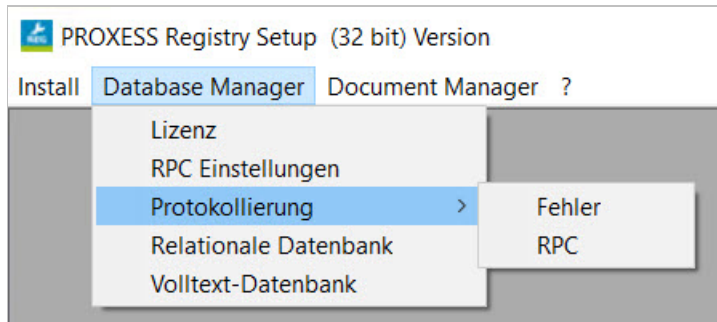

Fig.: Database Manager menu, Logging

<b>Registration key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\SHD\Document!\Dbil
<b>Brief description</b>	Control of log output (error messages, information and function calls)

# Magnitude

<b>Value name</b>	SevDumpLevel
<b>Data type</b>	REG_SZ
<b>Default value</b>	0 (= all exceptions)

Using this value, you can limit the output of exceptions in the log file to specific magnitudes.

<b>SevDumpLevel</b>	<b>Magnitude</b>	<b>Probable originator</b>
<b>0</b>	Recoverable	Client, Document Manager or Storage Manager
<b>1</b>	ClientFailure	Document Manager or Storage Manager
<b>2</b>	Resources exhausted	Memory fault, no database connections, etc....
<b>3</b>	Database failure	Relational database or full-text database (exclusive syntax error or timeouts)
<b>4</b>	DbilFailure	Internal error in the Database Manager

As you can see in the table, the numerical value of the magnitude is a scale for the severity of the error which occurred:

Recoverable exceptions occur if a syntactic error is committed or a timeout expires during a database query, for example.

An exception with the magnitudes of DatabaseFailure or even DbilFailure indicate a serious problem whose cause should be cleared up in any case.

For this reason, you can only specify the minimum magnitude from which exceptions are also logged, e.g. SevDumpLevel = 2 means that exceptions are recorded with the magnitudes ResourcesExhausted, DatabaseFailure and DbilFailure.

You cannot limit the output of information and start & stop times.

## RPC Error Log Local PC, General tab

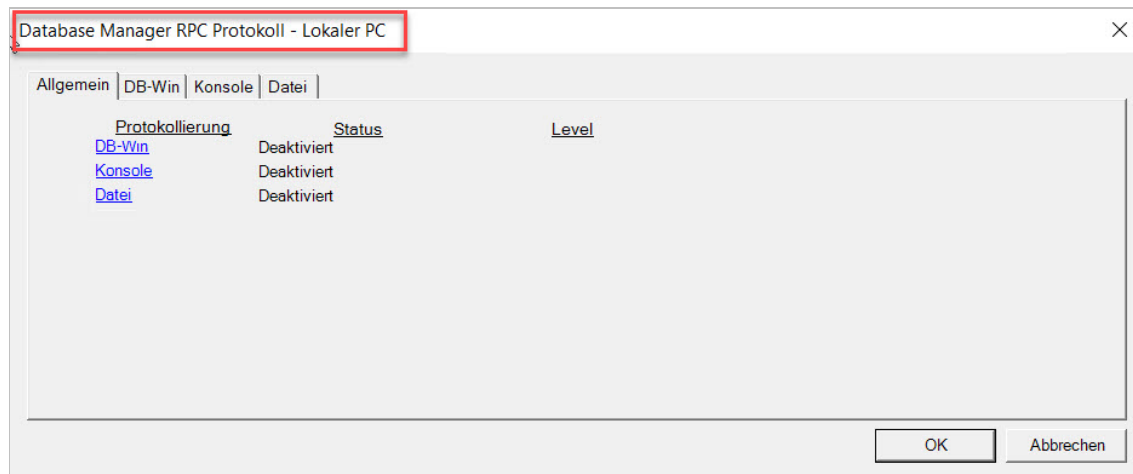

Figure: "Database Manager RPC Log –Local PC, General"

<b>Registration key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\SHD\Document!\Dbil
<b>Brief description</b>	Control of log output (error messages, information and function calls)

In this window, you can see the current status of logging settings.

Logging of the Database Manager supports the output formats DB-Win, console and file.

The status indicates whether logging is being carried out.

The level indicates the minimum magnitude of logging.

## Error Log Local PC, DB-Win tab

Figure: "Database Manager Error Log –Local PC, DB-Win"

<b>Registration key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\SHD\Document!\Dbil
<b>Brief description</b>	If Windows debug logging is activated here, the following options are available: Debug/Information/Warning/Error/Critical for selection. The Debug setting is recommended, as is logging everything as well.

In this window, you can see the currently set status of logging.

## Error Log Local PC, General tab

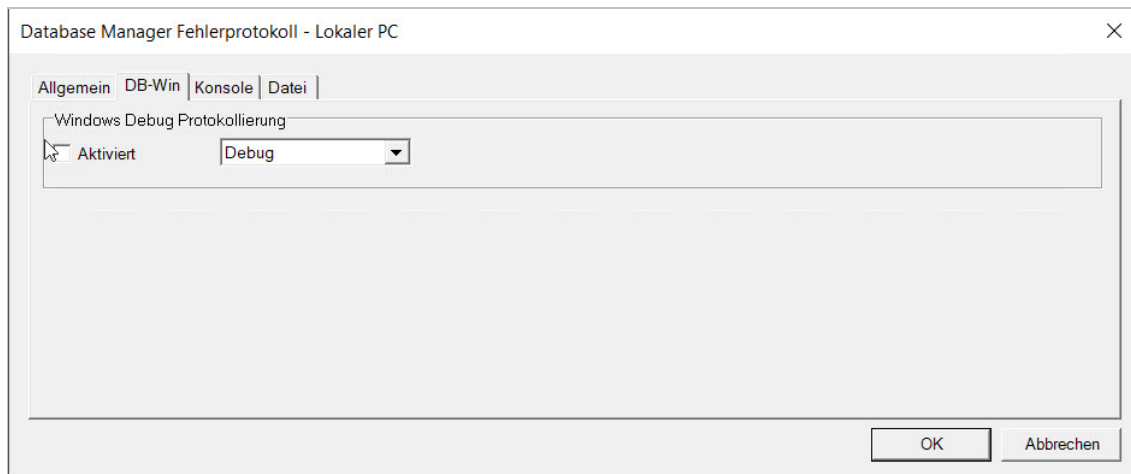

Fig.: Error log for Database Manager (tab: General)

In this window, you can see the current status of logging settings.

Logging of the Database Manager supports the output formats DB-Win, console and file.

The status indicates whether logging is being carried out.

The level indicates the minimum magnitude of logging.

<b>Value name</b>	LogPath
<b>Data type</b>	REG_SZ
<b>Default value</b>	Dbil.log

For this value, you declare the desired path name of the exception log file. The selected directory must already exist before program startup.

If you enter a valid path name, the starting and stopping of the Database Manager, at a minimum, is also logged regardless of the selected output medium.

## Error Log Local PC, File tab

Figure: "Database Manager Error Log –Local PC, File"

<b>File logging</b>	
<b>Activated</b>	If file logging is activated here, the following options are available: Debug/Information/Warning/Error/Critical for selection. The <b>Debug</b> setting is recommended, as is logging everything as well.
<b>Split file</b>	If the Split file option is selected here, the file is split into several individual files.
<b>Maximum parts</b>	If the file is split, the number of new files entered here are created before the old files are overwritten. A value between 1 and 100 can be selected.
<b>Maximum size</b>	Specifies the maximum size of an individual file. The size can be between 1 and 50 MB.
<b>Path</b>	The path where the log file is to be written is entered here.

In this window, you can see the currently set status of logging.

## Error Log Local PC, Console tab

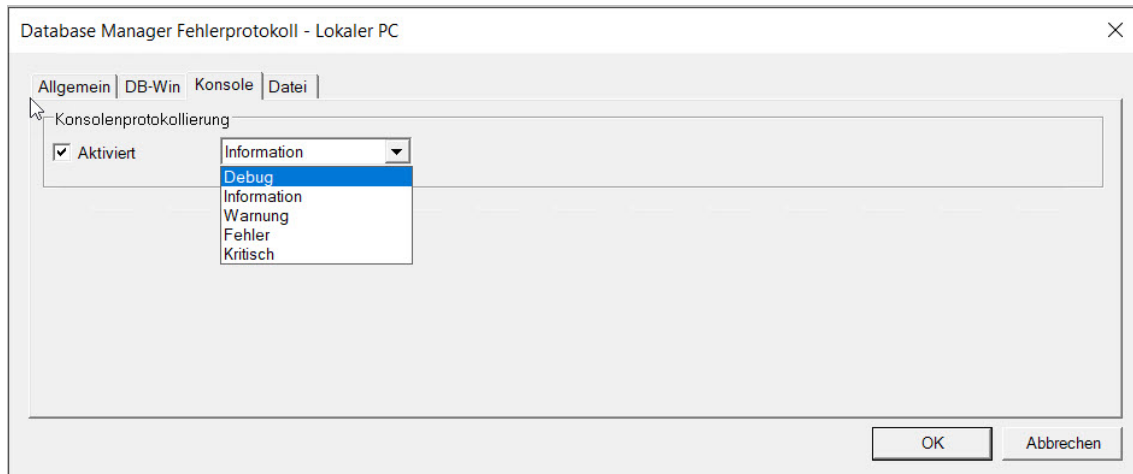

Figure: "Database Manager Error Log –Local PC, Console"

<b>Registration key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\SHD\Document!\Dbil
<b>Brief description</b>	If console logging is activated here, the following options are available: Debug/Information/Warning/Error/Critical for selection. The Debug setting is recommended, as is logging everything as well.

In this window, you can see the currently set status of logging.

## RPC Error Log Local PC, DB-Win tab

Figure: "Database Manager RPC Log –Local PC, DB-Win"

<b>Registration key</b>	<b>HKEY_LOCAL_MACHINE\SOFTWARE\SHD\Document!\Dbil</b>
<b>Brief description</b>	If Windows debug logging is activated here, the following options are available: Debug/Information/Warning/Error/Critical for selection. The Debug setting is recommended, as is logging everything as well.

In this window, you can see the currently set status of logging.

## RPC Log Local PC, File tab

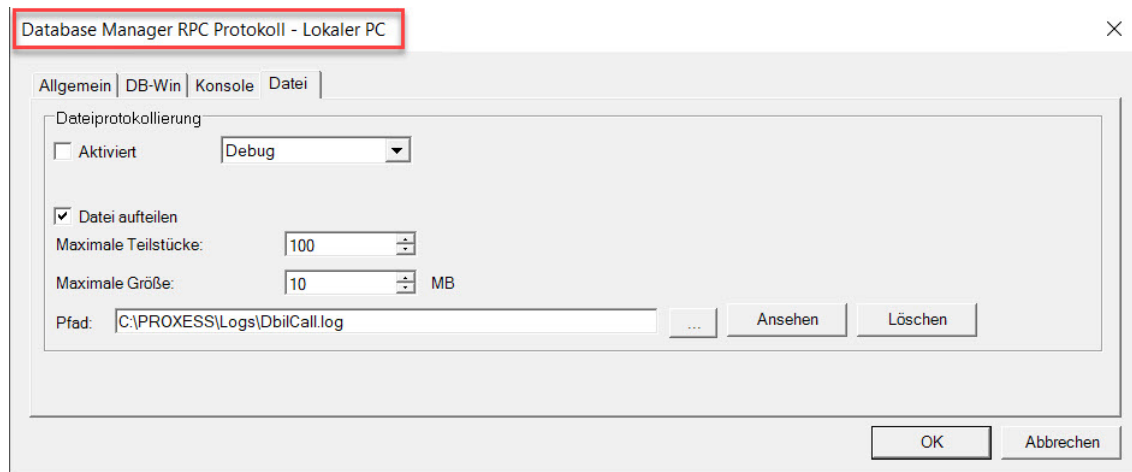

Figure: "Database Manager Error Log –Local PC, File"

File logging	
Activated	If file logging is activated here, the following options are available: Debug/Information/Warning/Error/Critical for selection. The <b>Debug</b> setting is recommended, as is logging everything as well.
Split file	If the Split file option is selected here, the file is split into several individual files.
Maximum parts	If the file is split, the number of new files entered here are created before the old files are overwritten. A value between 1 and 100 can be selected.
Maximum size	Specifies the maximum size of an individual file. The size can be between 1 and 50 MB.
Path	The path where the log file is to be written is entered here.

In this window, you can see the currently set status of logging.

## RPC Log Local PC, Console tab

Figure: "Database Manager Error Log –Local PC, Console"

<b>Registration key</b>	<b>HKEY_LOCAL_MACHINE\SOFTWARE\SHD\Document!\Dbil</b>
<b>Brief description</b>	If console logging is activated here, the following options are available: Debug/Information/Warning/Error/Critical for selection. The Debug setting is recommended, as is logging everything as well.

In this window, you can see the currently set status of logging.

# Relational Database command

Registry Setup prompts you to specify the database which you are using after selecting this command. Depending on this, you are led through different dialog boxes.

If you select the Relational Database command in the "Database Manager" menu, the following windows opens:

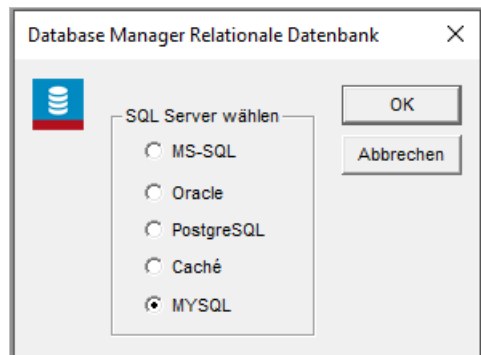

Figure: "Database Manager Relational Database" dialog box

<b>Database type</b>	In this option group, select the database you would like to use. When you confirm your choice with OK, a corresponding dialog box for the other steps opens.
<b>Registration key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\SHD\Document!\Dbil\Relational Database
<b>Brief description</b>	Configuration for specification of the corresponding relational database

<b>Database directory</b>	Here you specify where the database is located.
<b>Max. number of connections</b>	Here you determine how many client connections between dbil and SQL Server are permitted.

## Settings tab (Oracle)

Figure: Settings tab (Oracle)

<b>Date format</b>	Here you specify the date format (D/E).
<b>Max. number of connections</b>	Here you determine how many client connections between dbil and SQL Server are permitted.
<b>Service</b>	To be able to register the service, absolute path specification is required in the license.

# Update tab (SQL/MySQL)

Figure: Update tab (SQL)

<b>Time for update</b>	"Update statistics" optimization
------------------------	----------------------------------

## RPC Settings command

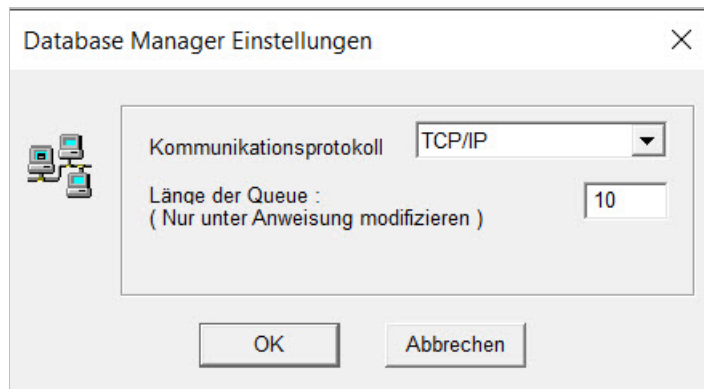

Figure: "Database Manager RPC Settings" dialog box

## Communication protocol

<b>Value name</b>	ListenProtSeq
<b>Data type</b>	REG_SZ
<b>Default value</b>	<no entry>

Communication between the Document Manager and the Database Manager or between the Storage Manager and the Database Manager is carried out through "remote procedure calls" (RPCs). For this value entry, you specify the network protocol on the basis of which Database Manager accepts network requests. This value must match the protocol with which the Document Manager and the Storage Manager attempt to address the Database Manager.

The following protocols are available for selection:

<b>Protocol</b>	<b>Entry in the registration</b>
<b>Local server</b>	ncalrpc
<b>Netware SPX/IPX</b>	ncacn_spx
<b>TCP/IP</b>	ncacn_ip_tcp
<b>Named Pipes</b>	ncacn_np
<b>NetBIOS over IPX</b>	ncacn_nb_ipx
<b>NetBIOS over TCP/IP</b>	ncacn_nb_tcp

<b>NetBIOS over NetBEUI</b>	ncacn_nb_nb
<b>DECNet</b>	ncacn_dnet_nsp
<b>Datagram over IPX</b>	ncadg_ipx
<b>UDP/IP</b>	ncadg_ip_udp

Keep in mind that the possible selections of the individual protocols naturally depend on the network components installed on your system.

	<p>Check whether the setting for the Document Manager matches the setting selected here. For this purpose, choose the "Document Manager" menu, Network command, Database Manager option group and Communication protocol field.</p> <p>If you would like to check the settings for the Storage Manager in a similar way, you can do so in the Storage Manager Explorer.</p>
---	---

## Length of the queue

<b>Value name</b>	ListenMaxCalls
<b>Data type</b>	REG_DWORD
<b>Default value</b>	10

This value entry specifies a lower estimate for the maximum number of remote procedure calls which the Database Manager can handle at one time. The RPC runtime library guarantees that the server allows at least the desired number of simultaneous function calls. For this purpose, a queue in which space for a corresponding number of sub-processes is reserved is already created when the program is started up.

If the load on the system exceeds the announced maximum load, the RPC runtime library automatically enlarges the queue. Sub-processes which are no longer required are reduced back to the specified limit when the system load is lower, however.

### Warning information

	<p>Should the load on the system increase so much that sub-processes can no longer be increased quickly enough to cover demand, an error message such as the following may be output:</p> <p>"The RPC server is too busy to complete this operation." (error code: 1723)</p> <p>Only in this case should this value entry be changed in coordination with PROXESS support of your supplier.</p>
---	---

<b>Registration key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\SHD\Document!\Dbil
<b>Brief description</b>	Configuration of communication between the Document Manager (kernel) and the Database Manager or between the Database Manager and the Storage Manager.

## Full-Text Database command

Here, you have to first activate and select the full-text database for PROXESS:

Fig.: Selection dialog for the full-text database

If the Apache Lucene full-text database is selected, the full-text database setting dialog appears.

### Tips

The Apache Solr full-text engine is activated with the Full-Text entry in the Document Manager menu.

On this, see: [Full-Text Database command](#)

[Full-Text Backup tab \(Lucene\)](#)

## General Full-Text Settings tab (Lucene)

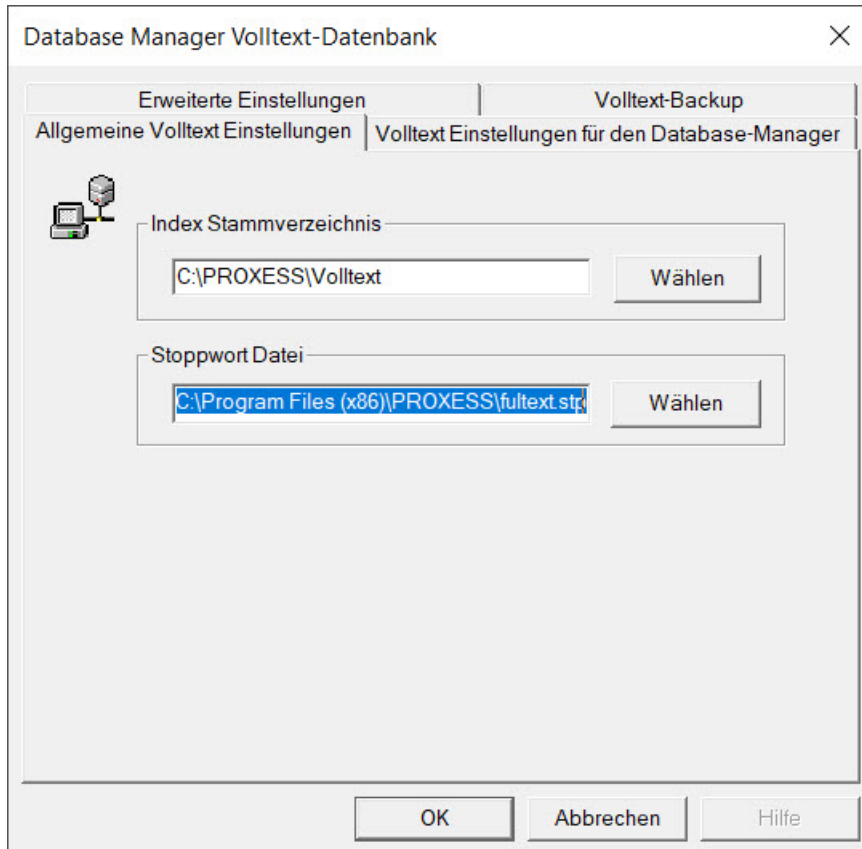

Fig.:General Full-Text Settings

<b>Root directory index</b>	The directory in which the Lucene index is to be constructed
<b>Stop word file</b>	The stop word file which contains a list of words not to be taken into account during indexing.

If relative paths are specified, they only refer to the directory in which **Dbil.exe** is executed.

	<p>For a full-text search with Lucene, the *and ? symbols are also supported in addition to the previous % and _ wild card symbols.</p> <p>The % and * symbols stand for any number of characters.</p> <p>The _ and ? symbols stand for exactly one character.</p> <p>These characters can be mixed as desired within a search expression. The following conversions are equivalent, for example:</p> <p>Pr__e% ? Pro?_e% ? Pro_?e* ? Pro??e*</p> <p>All four variants are successful for "PROXESS".</p>
---	--

## Advanced Properties (Lucene) tab

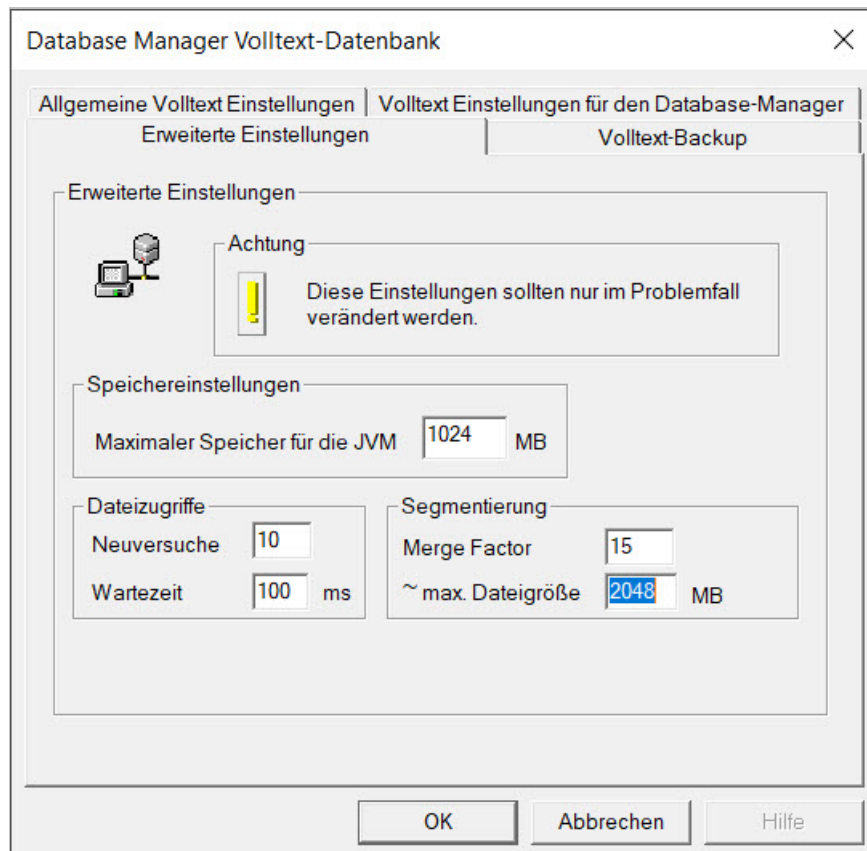

Fig.: Advanced properties of the full-text database

	<p><b>Warning information</b></p> <div style="border: 1px solid black; padding: 5px; margin: 5px 0;">  <p><b>These settings should only be changed in case of a problem.</b></p> </div>
<b>Memory settings</b>	<p><b>Maximum memory for the JVM:</b> The maximum available RAM for the Java Virtual Machine (JVM) in which the Lucene full-text engine will run is specified in megabytes here.</p> <p><b>Recommendation:</b> The value entered here should be no less than 512 MB (recommended: 1,024 MB), and the system should also have at least 1,024 MB (recommended: 2,048 MB) of RAM.</p>
<b>File access</b>	<b>No longer relevant; please do not change.</b>
<b>Segmentation</b>	<b>No longer relevant; please do not change.</b>

## Full-Text Backup tab (Lucene)

The screenshot shows a dialog box titled "Database Manager Volltext-Datenbank" with a close button (X) in the top right corner. The dialog has two tabs: "Allgemeine Volltext Einstellungen" and "Volltext Einstellungen für den Database-Manager". The "Volltext-Backup" sub-tab is active, showing the following settings:

- Backup-Funktion aktivieren
- Speicherort-Einstellungen**
  - Verzeichnis:
  - Backup-Modus:  (dropdown menu)
- Zeitsteuerung**
  - Montag
  - Dienstag
  - Mittwoch
  - Donnerstag
  - Freitag
  - Samstag
  - Sonntag
  - Startzeit:  :

At the bottom of the dialog are three buttons: "OK", "Abbrechen", and "Hilfe".

<b>Activate backup function</b>	The backup function can be activated or deactivated with the check box.
<b>Directory</b>	Root directory for the backup In each case, an additional subdirectory is created. Relative paths refer to the storage location of Dbil.exe.
<b>Backup mode</b>	Selection of whether a new directory (folder with date) is to be created for each backup or whether the last saved backup is to be overwritten.
<b>Time control</b>	<u>Start time:</u> The first field (hour) permits values between 0 and 23. The second field (minutes) permits values between 0 and 59.

## Full-Text Settings tab for the Database Manager (Lucene)

Database Manager Volltext-Datenbank

Erweiterte Einstellungen | Volltext-Backup

Allgemeine Volltext Einstellungen | **Volltext Einstellungen für den Database-Manager**

Maximale Wartezeit nach Abfrage (in s.): (0 = unendlich lange)

Maximale Anzahl Verbindungen: (0 = unendlich viel)

Maximale Anzahl Volltexttreffer: (0 = keine Begrenzung)

Speichergröße (in MB):

Temporäre Dateigröße (in MB):

Pooling deaktivieren ?

OK Abbrechen Hilfe

<b>Max. wait time after query</b>	No longer relevant.
<b>Max. number of connections</b>	Maximum value for the number of connections from Database Manager to full-text database (recommended value = 0).
<b>Max. number of full-text hits</b>	You set the maximum value for the hitlist size for full-text searching here.
<b>Memory size (in MB)</b>	No longer relevant.
<b>Temporary file size (in MB)</b>	No longer relevant.
<b>Deactivate pooling?</b>	No longer relevant.

## Document Manager menu

The "Document Manager" menu contains the following commands:

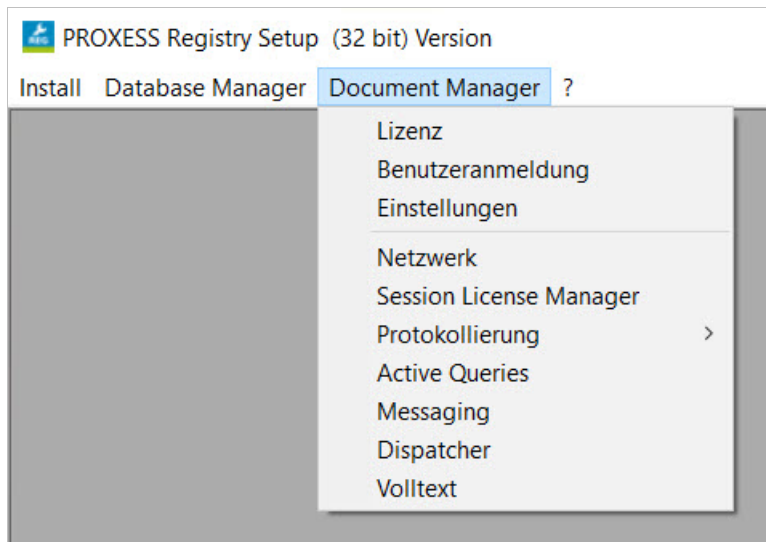

Figure: "Document Manager" menu

## License command

Note that you can then only successfully start the Document Manager if the corresponding license file is specified.

Figure: "Document Manager License" dialog box

Specify the path to the license file for the Document Manager here.

The **License.txt** value is specified by default. If you accept this value, PROXESS automatically searches the license file in the working directory in which the Document Manager is located.

Click the **View** button to view the license file.

If the Document Manager is to be started as a service, you have to enter the absolute path here (e.g. C:\Proxess\License.txt).

<b>Registration key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\ SHD\Document!\ Kernel\0
<b>Brief description</b>	Specification of the license file for the Document Manager.

# User Login command

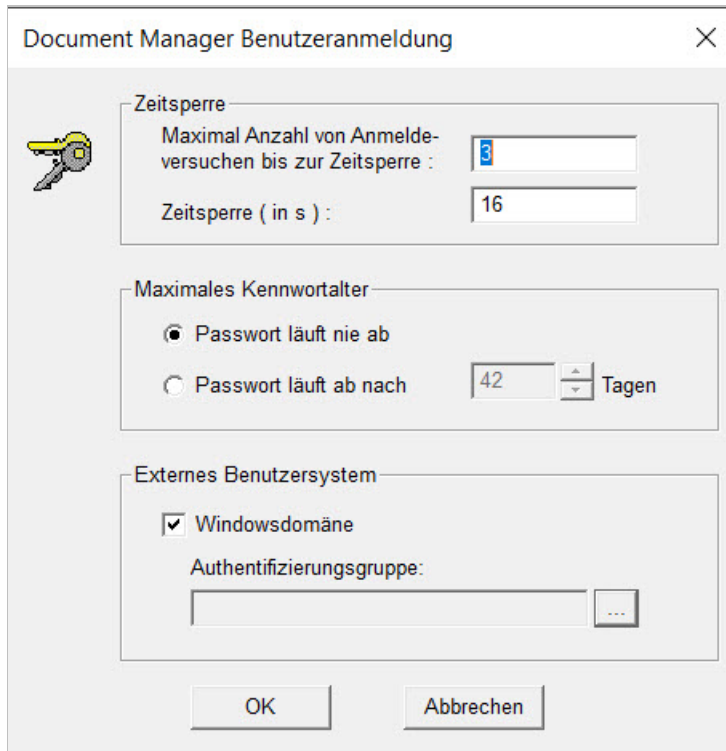

Figure: "Document Manager User Login" dialog box

If logging in through the **external user system**, the user data of Windows Active Directory is used. This prevents the double administration of user data. The Windows login data is transferred to PROXESS automatically. More information on this can be found in the documentation on the PROXESS Administrator Console.

## Warning information

	<p>For the PROXESS <b>authentication group</b>, be sure to never fall back on existing internal Windows user groups such as "Everyone".</p> <p>Since PROXESS regularly synchronizes the user groups, this will lead to performance problems with a large amount of user accounts.</p> <p>To avoid this, create a separate PROXESS group, which you can then select as an authentication group in the above dialog.</p>
---	--

<b>Registration key</b>	HKEY_LOCAL_MACHINE\SOFTWARE\SHD\Document!\Kernel\0
<b>Brief description</b>	Protection against unauthorized access

## Settings command

Figure: "Document Manager Settings" dialog box

<b>Language</b>	Here you can select between the server languages of German and English.
<b>Test time (in s)</b>	Log timeout for table access synchronization time for access to internal tables (max. wait time)
<b>Hitlist size</b>	Max. size of the hitlists (system-wide setting!)
<b>Hitlist sorting</b>	System-wide setting! <b>No sorting:</b> The oldest documents are displayed first (default setting). <b>Newest documents first:</b> Display of the newest documents first.
<b>Caching of validation rules</b>	Internal caching of the validation rules, e.g. for thesauruses (they do not have to be continuously polled by SQL Server in this case).
<b>Register as service</b>	The PROXESS Document Manager is registered as a Windows service.

"Document Manager" menu

## Dispatcher command

*Fig.: Dispatcher dialog*

The Dispatcher is the OCR engine for PROXESS and is installed with the PROXESS Professional package. An OCR license from a third-party provider (e.g. ABBY or Image Gear) is required for use.

Enter the server address of the Dispatcher here. The OCR server is generally installed locally on the PROXESS server. In the case of large systems, the OCR server may be set up as its own server for performance reasons.

## Full-Text Settings command

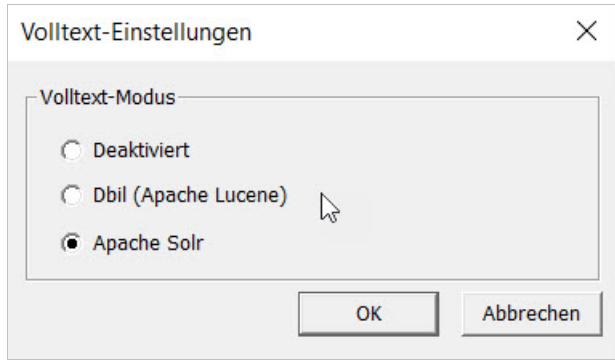

Fig.: Selection of the full-text database for the PROXESS system

<p><b>Deactivated</b></p>	<p>Full-text recognition is not active for the entire system.</p> <p>The settings in the Database Manager/Full-Text Database menu are not evaluated.</p>
<p><b>Dbil (Apache Lucene)</b></p>	<p>Apache Lucene (open source product) is used as the integrated full-text engine.</p> <p>Full-text recognition is controlled through the Database Manager.</p> <p>The settings in the Database Manager/Full-Text Database menu are crucial: If <b>Deactivated</b> has been selected here, full-text is not active!</p>
<p><b>Apache Solr</b></p>	<p>Apache Solr is used as the full-text engine by the system.</p> <p>The full-text engine is controlled by the Document Manager here.</p> <p>For this reason, the settings in the Database Manager menu -&gt; Full-Text Database do not play a role here either.</p> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;">  <p>Apache Solr is a standalone/external application addressed via http. Apache Solr is installed together with PROXESS Professional by default. The Document Manager uses the start and stop of Apache Solr.</p> </div>

# Full-text settings of Apache Solr

If you select the full-text engine Apache Solr in the Document Manager/Full-Text menu, the following setting dialog appears:

Fig.: Full-text settings for Apache Solr

	<p><b>In Standard mode, you don't have to make/change any settings here.</b></p> <p>These settings are only necessary if</p> <ul style="list-style-type: none"><li>• the Solr server is to be operated on another machine</li><li>• access is to be secured using a user name/password</li><li>• communication is to be secured using an SSL certificate.</li></ul> <p>Comprehensive instructions on Apache Solr can be found on the Apache website (<a href="https://solr.apache.org/guide/8_5/">https://solr.apache.org/guide/8_5/</a>).</p>
---	--

<b>Solr endpoint URL</b>	Address of the full-text database for PROXESS
<b>Use user login</b>	The PROXESS Document Manager uses the specified values to connect with the Apache Solr server.  By default, this function is deactivated.
<b>Accept self-signed certificates (HTTPS)</b>	If Solr has been configured for the HTTPS protocol, you can specify whether the Document Manager accepts self-signed certificates here.  By default, this function is deactivated.

<p><b>Start local Solr server automatically</b></p>	<p>The Document Manager starts the also-installed Apache Solr server automatically during service startup and ends it again when the service is exited.</p> <p>By default, this function is also activated.</p> <p>The automatic start/stop version only works if the endpoint address is <i>localhost!</i></p>
---	---

## Help Topics

In this section, you can find the current online help. You can find the documentation as a PDF file in the program group PROXESS/Documentation.

## About Registry Setup

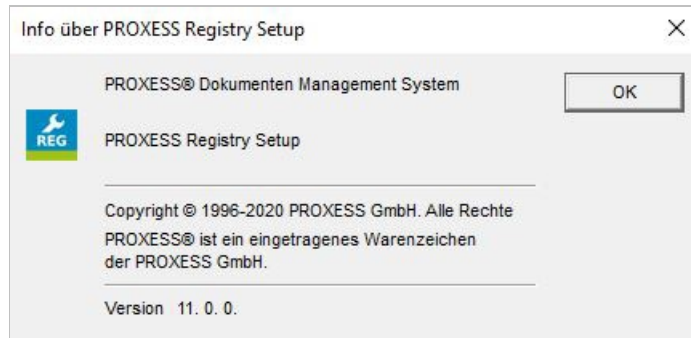

Figure: "About PROXESS Registry Setup" dialog box

In this section, you can find information on your current program version.

## Computer Name

Figure: "Computer Name Command" dialog box

PROXESS Registry Setup changes the registration on the **local** computer by default. If you are logged in under a user account with the corresponding authorization, you can carry out configuration of any computer on your network.

If you would like to change the registration of another computer on the network, enter the desired computer name with this command.

To be able to use this function, you have to have the corresponding Windows authorization on the network!
